

EnerGXpert releases GX Desktop interval and billing data energy management solution helping businesses manage energy usage and save money

Denver, CO – June 16, 2008 – EnerGXpert (www.energxpert.com) announced today the release of their enerGXpert GX suite of internet based energy management solutions, the first software solution that enables energy management professionals to monitor their energy use data, billing data and identify energy reduction and cost saving opportunities in one integrated system.

“Increasing energy costs are causing energy management professionals to adopt energy reduction measures in their business as a key strategy for reducing costs, enhancing the bottom line and gaining a competitive advantage”, said John Fast, President and CEO of enerGXpert. “We are proud to be the first to market with a real-time powerful tool that simplifies energy measurement and analysis, enabling energy managers to become energy experts by monitoring billing and interval data in one easy to use system”.

EnerGXpert is a real-time tool designed to show businesses precisely when and where they use energy and enables them to understand how much energy they are using relative to operations and weather trends as well as comparing current energy usage with historic trends. The host of intuitive reports integrates financial data and energy usage data so facility managers, property managers and energy managers can identify cost savings opportunities.

“Our solution provides the ability to perform sophisticated analysis of business operations by mapping billing data to usage data. With this valuable information, irregularities in utility bills can be more easily identified, helping businesses identify and resolve billing issues more quickly”, said Gene Palumbo, Vice President of Marketing. “EnerGXpert provides a monthly financial summary and helps businesses estimate and budget future energy costs, empowering energy managers to effectively control costs, energy usage and drive a positive impact on the environment”.

EnerGXpert can track two years or more of monthly or daily interval meter data. Customer reports and graphs give businesses the ability to view their entire enterprise or zero in on a specific meter. Drill down charting provides the ability to quickly investigate the root cause of energy usage fluctuations, take corrective action and reduce the financial impact of operational aberrations.

About enerGXpert

EnerGXpert is an emerging leader in the energy information services industry and provides businesses with easy to use internet based energy management solutions to identify energy reduction opportunities, lower costs, reduce environmental impact and sustain these benefits over time. The company works with over 500 companies including Pepsi Center, Vail Resorts, Denver International Airport and Safeway Supermarkets to help them understand their energy usage. EnerGXpert has extensive experience working closely with North American utilities including Xcel Energy, giving them excellent insight into utility processes and information.
